Software Company Employee Management App (StaffAdmin) - Instructions

- **Before starting the app**
  Restore the StaffAdmin.bak sql database backup on your localhost\SQLEXPRESS.
  The StaffAdmin.bak is found in the GitHub repository
  https://github.com/RMKasavuli/StaffPositions along with the app solution source folder.

- **Starting the app**
  Clone the repository on your computer, build and run (F5) or right-click on
  StaffPositions.WebUI project and view in your browser of choice.

- **User Privileges – Admin User**
  There is a user account in the database of email gaspard@dev.com. This user is the
  admin of the app and the manager of the company, he is the only user able to access
  the admin page where he can edit positions as well as assign the developers to their
  supervisors. His password is '**Kitabuyakubu@7**'

- **Accounts and Profile**
  Profiles have a first name, last name, position picture, email and password.
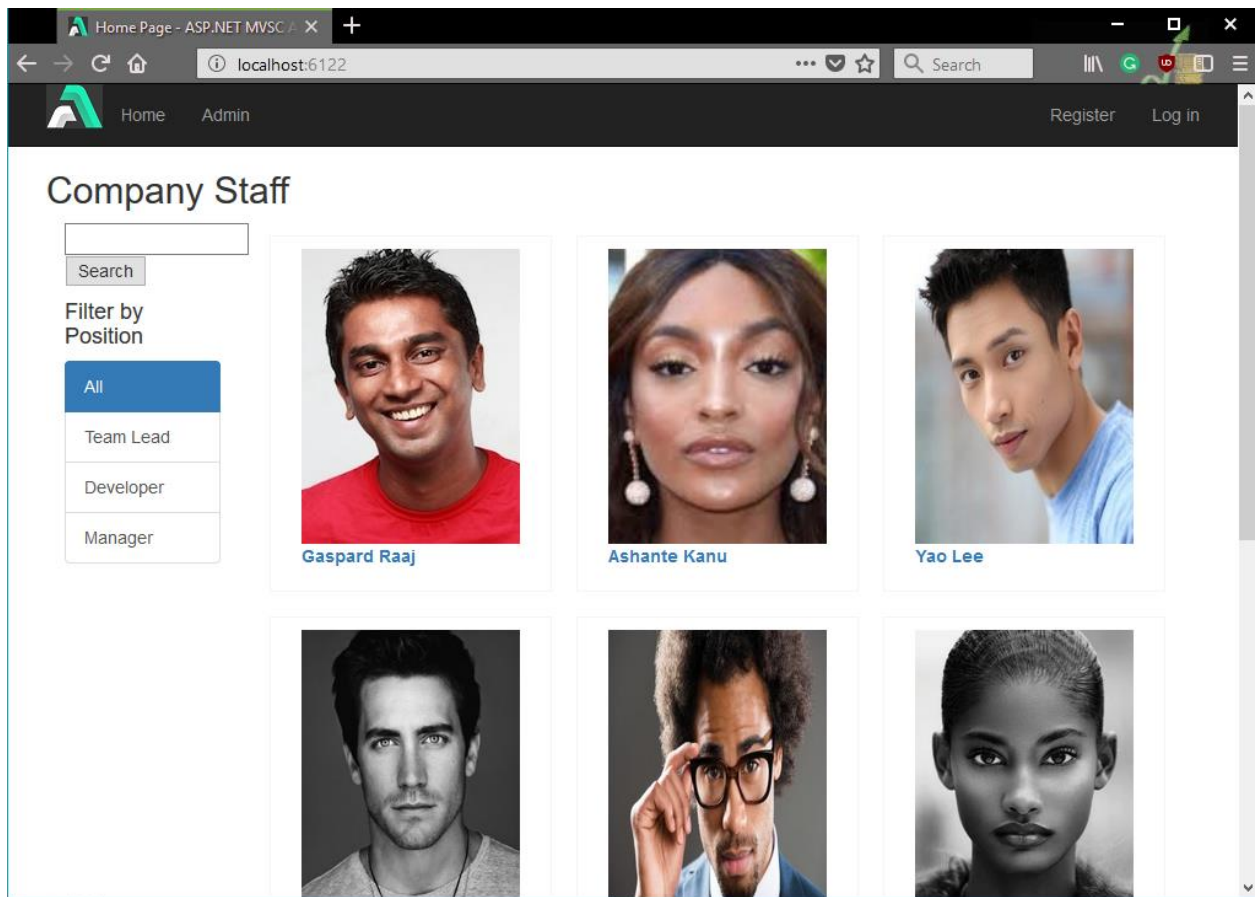

- **The Register Page**
  The page allows to register an account, each account registered is automatically an
  employee, but not all employees have an account as a manager or admin can add
  employees to the database without them having to register.

- **The Log in Page**
 The login credentials are email and password.

- **The Home Page**
  The home page allows an overall view of all the company workers and has a search
  functionality and a sorting functionality.

- **The Admin Page**
  This page is only accessible by the Gaspard and allows to access the employees'
 positions admin and the Employees management.

- **The Employees Positions Page or Employees Positions Admin Page**
  This page allows to create, edit or delete the position, but shouldn't be used as we want
  the three positions already in the database to remain Manager-Team Lead-Developer.

- **The Employees Page or Employees Management Page**
  This page provides the list of workers showing their names, positions and relationship to their superiors or supervisors. The workers can be edited from here and assigned to a different superior based on their position. E.g. the manager can't be assigned to a superior, team leaders can only be assigned to a manager who is already in the database and the developers can only be supervised by existing team leaders.
